EP 0 539 025 B1

Description

This invention relates to a water soluble polymer which encapsulates particles made of an emulsifiable mixture of a fragrance and a wax to form microcapsules which are used to improve the deposition of fragrance onto fabrics.

The use of fragrance to provide a pleasing scent to freshly dried fabrics, as well as to modify or enhance the fragrance of fabric conditioning articles, is both desirable and well known in the art as illustrated in U.S. 4,954,285 issued to Wierenga et al. However, the efficient deposition of such perfumes on fabrics as well as the manufacturing of fabric conditioning articles has not been achieved to date. The volatile perfumes tend to be lost during manufacturing of the tumble drier sheets as well as during their storage and use by the consumer.

Various techniques have been tried in the prior art to address these problems. In general, these techniques involve entrapping the volatile fragrance oil with a coating or mixing the oil with a suitable carrier.

Solid fragrance particles have also been prepared by mixing and absorbing the fragrance oil with a solid carrier to deliver fragrance to a product.

In U.S. 4,152,272 particles are formed from a perfume/wax mixture. The resulting particles are primarily incorporated into an aqueous fabric conditioner composition. This type of perfume/wax particle is undesirable for the manufacture of such particles into a tumble drier sheet because the molten fabric softener actives deposited on the sheets reach temperatures of up to 80°C. Such manufacturing temperatures would cause the majority of the perfume containing particles with melting points below the processing temperature to melt, releasing the majority of the fragrance during manufacturing of the sheets rather than being deposited on the drying fabrics. For those wax/perfume particles having melting points above the processing temperature the perfume is extracted by the molten active softener material.

In U.S. 4,954,285, 4,536,315 and 4,073,996 perfumed oils are mixed and absorbed with an inorganic carrier such as clay or silica to deliver perfume in detergents and fabric softeners. In U.S. 4,326,967 and EP 334,666 perfumes are emulsified in a wax or solid surfactant and the fragrance oil is released during heat treatment such as in a drier.

A fragrance containing polymer incorporated in detergent compositions comprising a water soluble polymer, a water insoluble polymer and a perfume composition which is part of both the water soluble and water insoluble polymers is described in U.S. 4,842,761. The two polymers are physically associated with each other so that one polymer forms discrete entities in the matrix of the other polymer.

In general, although these free flowing solid particles provide for the controlled release of the fragrance oil, the fragrance oil is generally not sufficiently protected so that it is frequently lost or destabilised during processing. It is also difficult to extract the fragrance when desired during use.

In U.S. 4,842,761 the perfume capsules largely depend on increasing size to increase the amount deposited on clothes or fabrics and compensate for perfume lost during processing. Additionally, the particles require a large amount of water (e.g. wash or rinse liquor) to release the fragrance oils. Thus, the polymer matrix of the '761 patent would not effectively deliver fragrance at the end of the drying cycle.

Water dispersible polymers have been used to encapsulate fragrance oils in conventional spray drying processes as described in U.S. 4,276,312; 3,971,852; 3,821,436; 3,758,323; 3,455,838; 3,159,585 and 3,091,567. Such solid particles are made by emulsifying fragrance oils into an aqueous solution of the water dispersible polymer such as gum arabic, starch or gelatin. The emulsion is then sprayed into a column of hot air to yield free flowing microcapsules with the oil entrapped or encapsulated inside the water soluble polymer. Such spray drying techniques have been widely employed to make encapsulated fragrance particles. However, the conventional processes are not suitable for manufacturing the claimed composite microcapsule because large aggregates of perfume wax mixture are formed which cannot be spray dried.

EP-A-0 397 246 discloses coated perfume particles for inclusion in laundry compositions. The perfume is dispersed in a water-insoluble polymer such as polyethylene and particles of this mixture are provided with a friable coating which may be hydrophilic or hydrophobic but which is, preferably, water-insoluble. In Example 1 of this reference perfume is dispersed in Polywax 500, a polyethylene. After emulsification in aqueous gelatin to give a drop size of 100 micrometers a coating of gelatin-gum arabic coacervate is formed on the perfume articles.

It is an object of the invention to provide encapsulated fragrance particles which will prevent the release and loss of the majority of the fragrance oil during processing, storage and use of fabric conditioning articles and which will release the majority of the fragrance onto drying fabrics.

Additionally, the fragrance particles may be incorporated in a fabric softening composition and applied to a dispensing means to produce an article for use in automatic clothes dryers to condition fabrics. Another object of the invention is to provide a novel process for forming the claimed microcapsules to avoid loss of fragrance oils during processing, storage and use.

According to a first aspect of the invention there is provided a composite microcapsule containing a fragrance oil comprising:

- (a) particles composed of an emulsifiable mixture of a self-emulsifiable wax material and, optionally, a non-self-

EP 0 539 025 B1

emulsifiable wax material, and a perfume composition, the mixture having a melting point between 35 and 90°C, the ratio of self-emulsifiable to non-self-emulsifiable wax being at least 1:3, the particles having an average diameter of less than 5 micrometers; and

- 5 (b) a water soluble polymer encapsulating the particles to form composite microcapsules having a diameter less than 100 micrometers whereby the fragrance oil is released by dissolving the polymer upon contact with a liquid and melting the wax material at a temperature below 90°C, the microcapsules having been formed by a spray drying process.

10 In a second aspect there is provided a process for making a composite microcapsule of the first aspect comprising the steps of:

- (a) selecting a self-emulsifiable wax material and, optionally, a non-self-emulsifiable wax material, and a perfume composition to form an emulsifiable mixture having a melting point of between 35° and 90°C, the ratio by weight of self-emulsifiable to non-self-emulsifiable wax material being at least 1:3;
- 15 (b) selecting a water-soluble polymer;
- (c) melting the emulsifiable mixture in a reactor until a uniform solution is obtained;
- (d) adding water to the uniform solution to form an aqueous emulsion; and
- (e) adding the water soluble polymer to the aqueous emulsion and cooling the resulting mixture to form a stable emulsion; and
- 20 (f) spray drying the stable emulsion to yield a composite microcapsule having a diameter of less than 100 micrometers.

25 In a further aspect there is provided a tumble drier article of manufacture adapted for conditioning fabric in an automatic clothes drier comprising:

- (a) a fabric softening composition comprising a fabric softener selected from the group consisting of: cationic quaternary ammonium salts, tertiary fatty amines having at least one and preferably two C₈ to C₃₀ alkyl groups, carboxylic acids having 8 to 30 carbon atoms and one carboxy group per molecule, esters of polyhydric alcohols, fatty alcohols, ethoxylated fatty alcohols, alkyl phenols, ethoxylated alkyl phenols, ethoxylated fatty amines, ethoxylated monoglycerides, ethoxylated diglycerides, mineral oils, polyols and mixtures thereof;
- 30 (b) between 0.5 and 80% by weight of spray dried composite microcapsules having a diameter less than 100 micrometers, each microcapsule material comprising a water soluble polymer and individual particles of an emulsifiable mixture of a self-emulsifiable wax material and, optionally, a non-self-emulsifiable wax material and a perfume composition, the mixture having a melting point between 35 and 90°C and the ratio of self-emulsifiable to non-self-emulsifiable wax being at least 1:3; wherein the wax material and the perfume composition are dispersed in the water soluble polymer, the individual particles of the mixture of wax and perfume composition having an average diameter of less than 5 micrometers; and
- 35 (c) dispensing means for releasing the fabric softening composition and the microcapsules onto fabrics, the fabric softening composition being releasably attached to the dispensing means in a weight ratio of from 10:1 to 0.5:1 of the fabric softening composition to the dispensing means.
- 40

45 In some more detail, invention relates to composite microcapsules comprising a water soluble polymer encapsulating individual core particles formed from an emulsifiable mixture of wax and perfume. The emulsifiable mixture has a melting point of between 35°C and 90°C, preferably from 45°C to 85°C. The emulsifiable mixture should be emulsifiable in an aqueous solution to form core particles with a diameter of less than 5 micrometers and preferably less than 1 micrometer. The diameter of the microcapsules is no greater than 100 micrometers and preferably less than about 40 micrometers.

50 The emulsifiable mixture may optionally be combined with a surfactant. The microcapsules are prepared by forming an emulsion of the emulsifiable mixture and the water soluble polymer then spray drying the emulsion to form the microcapsules. The microcapsules may be coated onto a dispensing means for release onto fabrics in an automatic clothes drier. In such an application, moisture from the washed fabrics at least partially dissolves the water soluble polymer and the perfume diffuses out of the microcapsules or the released core particles. Temperatures of the drying cycle in the clothes drier may accelerate the release of the perfume by melting the wax of the core materials.

55 The wax materials which may be used to form the emulsifiable mixture in the invention include hydrocarbons such as paraffin wax and microcrystalline wax. Surfactant materials which may be used may be either cationic, anionic or nonionic surfactants such as an ethoxylated primary alcohol nonionic surfactant derived from C₁₆, C₃₀, C₄₀ and C₅₀ average carbon chain length primary alcohols; a fabric softening component; or alkyl sulphonate. Preferred surfactant materials are an ethoxylated primary alcohol and a cationic fabric softening compound, such as a quaternary ammonium

EP 0 539 025 B1

compound.

Suitable water soluble polymers for use in the invention include synthetic polymers and natural or modified natural polymers with molecular weights of less than 100,000.

5 Detailed Description of Preferred Embodiments of the Composites Microcapsules

The composite microcapsules of the invention may be added to tumble drier articles to provide eventual release of perfume compositions onto fabrics. The microcapsules are composed of small particles of an emulsifiable mixture of a wax and perfume composition optionally combined with a surfactant. The particles are individually embedded in a water soluble polymer matrix. Thus multiple release modes are used to deposit the perfume fragrance onto fabrics. Specifically the polymer matrix dissolves, partially or completely, upon contact with wet fabrics and the perfume of the particles diffuses out. Diffusion is accelerated by melting the wax of the particles. The microcapsules may be incorporated in a tumble articles to releasably control the deposition of the perfume fragrance onto fabrics during drying.

The water soluble polymer matrix of the microcapsules at least partially dissolves upon contact with washed fabrics from a washing cycle. Perfume then may diffuse from released particles or from particles still within the partially dissolved polymer material.

The emulsifiable material has a melting point defined as the highest transition temperature above the point where the emulsifiable mixture becomes a flowable liquid, as measured by a conventional Differential Scanning Calorimeter. The core materials should be emulsifiable in an aqueous solution. The melting point of the particles is between 35°C and 90°C and preferably from 45°C to 85°C.

In a preferred embodiment, a portion of the composite particles remain on the fabrics intact at the end of the drying cycle so that fragrance may be released while the fabrics are being ironed or worn by the consumer.

The microcapsules of the present invention advantageously deposit a greater proportion of fragrance composition on drying clothes than prior art methods used in the art. Additionally, less fragrance is lost during the manufacturing of the tumble drier article of the invention. Therefore, less of the perfume composition is needed to form the microcapsules to impart a greater proportion of perfume fragrance, such as the top notes of the perfume, on fabrics. Diffusion of fragrance is further significantly reduced during storage so that the fragrance is efficiently used for the purpose intended, rather than perfuming the environment.

The microcapsules are less than 100 micrometers in diameter, preferably 3 to 100 micrometers and most preferably 3 to 40 micrometers. The particles embedded in the microcapsules have an average diameter of 5 micrometers and preferably less than 1 micrometer. Spherical microcapsules are preferred, however, any geometric shape known in the art may be used within the scope of the invention.

Preferably the microcapsules are solid at room temperature but may also be in gel form.

35 Emulsifiable Material

The term "emulsifiable mixture" is used to refer to a mixture of wax and perfume, optionally containing a surfactant, which forms an emulsion upon melting and dispersing into water, and has a melting point of between 35°C and 90°C, preferably from 45°C to 85°C.

The melting point of the emulsifiable mixture is defined as the highest transition temperature (measurable by a conventional Differential Scanning Calorimeter) above the melting point at which the emulsifiable liquid becomes flowable or pourable.

The wax of the invention includes hydrocarbons such as paraffins and microcrystalline waxes. The optional surfactant includes cationic surfactants, preferably fabric softening materials; ethoxylated primary alcohol nonionic surfactants, preferably those derived from C₁₆, C₃₀, C₄₀ or C₅₀ average carbon chain length alcohols; anionic surfactants such as alkyl sulphonate, polymeric surfactants and mixtures thereof.

The paraffin and microcrystalline waxes used in the invention are self-emulsifiable, but such self-emulsifiable waxes may be combined with non self-emulsifiable waxes to form a material within the scope of the invention.

Waxy materials which are contemplated within the scope of the present invention are presented in Table 1 below:

Self-Emulsifiable Waxy Materials

A non self-emulsifiable wax such as Unilin 700 may be combined with a self-emulsifiable wax such as Duroxon J-324 in approximately equal ratios to form a material within the scope of the invention. The ratio of self-emulsifiable wax to non self-emulsifiable wax is preferably in the range of 1:3 to 100% self-emulsifiable wax, and preferably 1:1.

Another embodiment of the invention is the combination of a surfactant, such as a cationic fabric softening component with a paraffin wax in a ratio of 1:1 fabric softening component to wax to form the particles in which the perfume composition is embedded.

Any conventional fabric softening component described below for use to form a tumble drier article may be used in combination with a wax or polymeric alcohol to form the particles of the microcapsules.

Water Soluble Polymers

The water soluble polymers which are suitable for use in the invention include synthetic polymers and natural or modified natural polymers with molecular weights of less than 100,000.

Examples of synthetic water soluble polymers are:

(1) polyvinyl pyrrolidone;

(2) water soluble celluloses;

EP 0 539 025 B1

(3) polyvinyl alcohol;

(4) ethylene maleic anhydride copolymer;

5 (5) methyl vinyl ether maleic anhydride copolymer;

(6) polyethylene oxides;

10 (7) water soluble polyamide or polyester;

(8) copolymers or homopolymers of acrylic acid such as polyacrylic acid, polystyrene acrylic acid polymers or mixtures of two or more;

15 Examples of water-soluble hydroxylalkyl and carboxyalkyl cellulose include hydroxyethyl and carboxymethyl cellulose, hydroxyethyl, and carboxyethyl cellulose, hydroxymethyl and carboxymethyl cellulose, hydroxypropyl carboxymethyl cellulose, hydroxypropyl methyl carboxyethyl cellulose, hydroxypropyl carboxypropyl cellulose, hydroxybutyl carboxymethyl cellulose, and the like. Also useful are alkali metal salts of these carboxyalkyl celluloses, particularly and preferably the sodium and potassium salts.

20 Examples of water soluble natural and modified natural polymers are starch, gums and gelatin. Modified starch in its myriad of forms, including dextrans, is useful within the invention, as well as hydrolysed gums and hydrolysed gelatin. Various modified starches within the scope of the invention are described in Schoch et al., U.S. No. 2,876, 160.

Suitable hydrolysed gums within the invention include gum arabic, larch, pectin, tragacanth, locust bean, guar, alginates, carrageenans, cellulose gums such as carboxyl methyl cellulose and karaya.

25 Modified starch suitable for the invention has a dextrose equivalent of 0.25 up to about 20, preferably 5 to 15.

A wide range of starch hydrolysates having dextrose equivalents of up to 95 are also useful. Until recently these starch hydrolysates, also called maltodextrins and dextrans were produced from various starches by acid hydrolysis. The hydrolysates resulting from this acid process are not completely soluble in water, and contain native starch. Suitable starches are derived from corn, waxy maize, tapioca, etc.

30 Perfume compositions

The perfume composition of the emulsifiable mixture is characterized as an oil composition which is insoluble but water dispersible and may be either volatile or non-volatile. Perfume compositions should also be blended to impart aromas which compliment the products in which the microcapsules will be used. For example, tumble drier sheets may

35 incorporate a lemon scent, woody scent, bouquet fragrance, etc. to impart the feeling of cleanliness and fine laundry. Deofragrance compositions described in Hooper, U.S. 4,134,838 and 4,322,308 may be utilized within the present invention.

Perfume is released from the microcapsules and deposited on fabrics by at least partially dissolving the water soluble polymer of the microcapsules. Fragrance diffuses from the exposed or released particles. When the temperature

40 is subsequently applied to the particles the wax is substantially melted and the perfume diffusion rate is accelerated. In the preferred embodiment, water left in washed fabrics at the end of the drying cycle substantially dissolves the water soluble polymer of the microcapsules which have deposited on the fabrics mostly by mechanical action in the tumbling dryer. Subsequently as temperatures in the dryer rise from about 40°C upwards toward 60-90°C the wax of the deposited particles is substantially melted to release fragrance onto the fabrics at the end of the drying cycle. It

45 may be understood that the skilled artisan may select waxes of higher melting points to control the release of the majority of the fragrance at the end of the cycle, within the scope of the invention. In another aspect of the invention the microcapsules may be engineered to provide deposit of the microcapsules on dried fabrics and release of the fragrance only upon ironing using steam and high temperatures. Perspiration and body heat may also be used to release fragrance during wear by consumer, an embodiment of particular interest when

50 deo-fragrance is used to form the particles.

Process

55 The composite microcapsules are prepared by spray-drying an aqueous dispersion. The aqueous dispersion is formed by emulsifying together the wax material and fragrance oil to form an emulsified mixture. In a reaction equipped with a stirrer, temperature controller and condenser. The reactor is heated and maintained at a temperature until the wax material and perfume are melted to form a smooth uniform solution. Water is then added to the uniform solution to form an aqueous wax/perfume emulsion. The emulsion is then cooled and the water soluble polymer is added to

EP 0 539 025 B1

form a stable emulsion which is spray-dried to yield solid microcapsules containing particles of wax material and perfume.

If a surfactant is desired, it is added to the emulsified mixture in the reactor.

5 Tumble Drier Article

The formed composite microcapsules may be mixed with an effective amount of a fabric conditioning composition and coated onto a dispensing means to form a tumble drier article. Such articles both condition fabrics in a tumble drier and impart a pleasant fragrance. The fabric conditioning composition has a preferred melting (or softening) point of 35°C to 150°C.

In one embodiment 0.5% to 80% of the composite microcapsules are mixed with the fabric conditioning composition, preferably 1% to 20% microcapsules are mixed with the conditioning composition and most preferably 2% to 10% microcapsules are mixed with the conditioning composition. Because the fragrance is incorporated into the microcapsules, fragrance loss during manufacturing, storage and use is significantly reduced over sheets containing fragrance incorporated by conventional means and by other encapsulation technologies in the art.

The fabric conditioning composition which may be employed in the invention is coated onto a dispensing means which effectively releases the fabric conditioning composition in a tumble dryer. Such dispensing means can be designed for single usage or for multiple use. One such multi-use article comprises a sponge material releasably enclosing enough of the conditioning composition to impart effective fabric softening during several drying cycles. This multi-use article can be made by filling a porous sponge with the composition. In use, the composition melts and leaches out through the pores of the sponge to soften and condition fabrics. Such a filled sponge can be used to treat several loads of fabrics in conventional dryers, and has the advantage that it can remain in the dryer after use and is not likely to be misplaced or lost.

Another article comprises a cloth or paper bag releasably enclosing the composition and sealed with a hardened plug of the mixture. The action and heat of the dryer opens the bag and releases the composition to perform its softening.

A highly preferred article comprises the compositions containing a softener and a compatible organosilicone releasably affixed to a flexible substrate such as a sheet of paper or woven or non-woven cloth substrate. When such an article is placed in an automatic laundry dryer, the heat, moisture, distribution forces and tumbling action of the dryer removes the composition from the substrate and deposits it on the fabrics.

The sheet conformation has several advantages. For example, effective amounts of the compositions for use in conventional dryers can be easily absorbed onto and into the sheet substrate by a simple dipping or padding process. Thus, the end user need not measure the amount of the composition necessary to obtain fabric softness and other benefits. Additionally, the flat configuration of the sheet provides a large surface area which results in efficient release and distribution of the materials onto fabrics by the tumbling action of the dryer.

The substrates used in the article can have a dense, or more preferably, open or porous structure. Examples of suitable materials which can be used as substrates herein include paper, woven cloth, and non-woven cloth. The term "cloth" herein means a woven or non-woven substrate for the articles of manufacture, as distinguished from the term "fabric" which encompasses the clothing fabrics being dried in an automatic dryer.

It is known that most substances are able to absorb a liquid substance to some degree; however, the term "absorbent", as used herein, is intended to mean a substrate with an absorbent capacity (i.e., a parameter representing a substrate's ability to take up and retain a liquid) from 4 to 12, preferably 5 to 7 times its weight of water.

If the substrate is a foamed plastics material, the absorbent capacity is preferably in the range of 15 to 22, but some special foams can have an absorbent capacity in the range from 4 to 12.

Determination of absorbent capacity values is made by using the capacity testing procedures described in U.S. Federal Specifications (UU-T-595b), modified as follows:

1. tap water is used instead of distilled water;
2. the specimen is immersed for 30 seconds instead of 3 minutes;
3. draining time is 15 seconds instead of 1 minute; and
4. the specimen is immediately weighed on a torsion balance having a pan with turned-up edges.

Absorbent capacity values are then calculated in accordance with formulae given in said Specification. Based on this test, one-ply, dense bleached paper (e.g., Kraft or bond having a basis weight of about 0,052 $\frac{\text{kg}}{\text{m}^2}$ (32 pounds per 3,000 square feet) has an absorbent capacity of 3.5 to 4; commercially available household one-ply towel paper has a value of 5 to 6; and commercially available two-ply household towelling paper has a value of 7 to about 9.5.

EP 0 539 025 B1

Suitable materials which can be used as a substrate in the invention herein include, among others, sponges, paper, and woven and non-woven cloth, all having the necessary absorbency requirement defined above.

The preferred non-woven cloth substrates can generally be defined as adhesively bonded fibrous or filamentous products having a web or carded fibre structure (where the fibre strength is suitable to allow carding), or comprising fibrous mats in which the fibres or filaments are distributed haphazardly or in random array (i.e. an array of fibres in a carded web wherein partial orientation of the fibres is frequently present, as well as a completely haphazard distributional orientation), or substantially aligned. The fibres or filaments can be natural (e.g. wool, silk, jute, hemp, cotton, linen, sisal, or ramie) or synthetic (e.g. rayon, cellulose ester, polyvinyl derivatives, polyolefins, polyamides, or polyesters).

The preferred absorbent properties are particularly easy to obtain with non-woven cloths and are provided merely by building up the thickness of the cloth, i.e., by superimposing a plurality of carded webs or mats to a thickness adequate to obtain the necessary absorbent properties, or by allowing a sufficient thickness of the fibres to deposit on the screen. A diameter or denier of the fibre (generally up to about 1.11 tex (10 denier)) can be used, inasmuch as it is the free space between each fibre that makes the thickness of the cloth directly related to the absorbent capacity of the cloth, and which, further, makes the non-woven cloth especially suitable for impregnation with a composition by means of intersectional or capillary action. Thus, any thickness necessary to obtain the required absorbent capacity can be used.

When the substrate for the composition is a non-woven cloth made from fibres deposited haphazardly in or random array on the screen, the articles exhibit excellent strength in all directions and are not prone to tear or separate when used in the automatic clothes dryer.

Preferably, the non-woven cloth is water-laid or air-laid and is made from cellulosic fibres, particularly from regenerated cellulose or rayon. Such non-woven cloth can be lubricated with any standard textile lubricant. Preferably, the fibres are from 5mm to 50mm in length and are from 0.17 to 0.56 tex (1.5 to 5 denier). Preferably, the fibres are at least partially oriented haphazardly, and are adhesively bonded together with a hydrophobic or substantially hydrophobic binder-resin. Preferably, the cloth comprises about 70% fibre and 30% binder resin polymer by weight and has a basis weight of from about 18 to 45g per square meter.

In applying the fabric conditioning composition to the absorbent substrate, the amount impregnated into or coated onto the absorbent substrate is conveniently in the weight ratio range of from 10:1 to 0.5:1 based on the ratio of total conditioning composition to dry, untreated substrate (fibre plus binder). Preferably, the amount to fix the conditioning composition ranges from 5:1 to 1:1, most preferably from 3:1 to 1:1 by weight of the dry, untreated substrate.

According to one preferred embodiment of the invention, the dryer sheet substrate is coated by being passed over a rotogravure applicator roll. In its passage over this roll, the sheet is coated with a thin, uniform layer of molten fabric softening composition contained in a rectangular pan at a level of about 12.5g/square metre. Passage of the substrate over a cooling roll then solidifies the molten softening composition. This type of applicator is used to obtain a uniform homogeneous coating across the sheet.

Following application of the liquefied composition, the articles are held at room temperature until the composition substantially solidifies. The resulting dry articles, prepared at the composition substrate ratios set forth above, remain flexible; the sheet articles are suitable for packaging in rolls. The sheet articles can optionally be slitted or punched to provide a non-blocking aspect at any convenient time if desired during the manufacturing process.

The fabric conditioning composition employed in the present invention includes certain fabric softeners which can be used singly or in admixture with each other.

Fabric Softener Component

Fabric softeners suitable for use herein are selected from the following classes of compounds:

(i) Cationic quaternary ammonium salts. The counterion is methyl sulphate or any halide, methyl sulphate being preferred for the drier-added articles of the invention. Examples of cationic quaternary ammonium salts include, but are not limited to:

(1) Acyclic quaternary ammonium salts having at least two C_{8-30} , preferably C_{12-22} alkyl chains, such as: ditallow dimethyl ammonium methylsulphate, di(hydrogenated tallow) dimethyl ammonium methylsulphate, distearyl dimethyl ammonium methylsulphate, dicocodimethyl ammonium methylsulphate and the like;

(2) Cyclic quaternary ammonium salts of the imidazolinium type such as di(hydrogenated tallow) dimethyl imidazolinium methylsulphate, 1-ethylene-bis(2-tallow-1-methyl) imidazolinium methylsulphate and the like;

(3) Diamido quaternary ammonium salts such as: methyl-bis(hydrogenated tallow amidoethyl)-2-hydroxyethyl ammonium methyl sulphate, methyl bis(tallowamidoethyl)-2-hydroxypropyl ammonium methylsulphate and the like;

EP 0 539 025 B1

(4) Biodegradable quaternary ammonium salts such as N,N-di(tallowoyl-oxy-ethyl)-N,N-dimethyl ammonium methyl sulphate and N,N-di(tallowoyl-oxy-propyl)-N,N-dimethyl ammonium methyl sulphate. When fabric conditioning compositions employ biodegradable quaternary ammonium salts, the pH of the composition is preferably adjusted to between about 2 and about 5. Biodegradable quaternary ammonium salts are described, for example, in U.S. Patents 4,137,180; 4,767,547 and 4,789,491.

(ii) Tertiary fatty amines having at least one and preferably two C₈ to C₃₀, preferably to C₁₂ to C₂₂, alkyl chains. Examples include hardened tallow amine and cyclic amines such as 1-(hydrogenated tallow)amidoethyl-2-(hydrogenated (tallow) imidazoline. Cyclic amines which may be employed for the compositions herein are described in U.S. Patent 4,806,255.

(iii) Carboxylic acids having 8 to 30 carbon atoms and one carboxylic group per molecule. The alkyl portion has 8 to 30, preferably 12 to 22 carbon atoms. The alkyl portion may be linear or branched, saturated or unsaturated, with linear saturated alkyl preferred. Stearic acid is a preferred fatty acid for use in the composition herein. Examples of these carboxylic acids are commercial grades of stearic acid and the like which may contain small amounts of other acids.

(iv) Esters of polyhydric alcohols such as sorbitan esters or glycerol stearate. Sorbitan esters are the condensation products of sorbitol or iso-sorbitol with fatty acids such as stearic acid. Preferred sorbitan esters are monoalkyl. A common example of sorbitan ester is SPAN 60 (ICI) which is a mixture of sorbitan and isosorbide stearates.

(v) Fatty alcohols, ethoxylated fatty alcohols, alkyl phenols, ethoxylated alkyl phenols, ethoxylated fatty amines, ethoxylated monoglycerides and ethoxylated diglycerides.

(vi) Mineral oils, and polyols such as polyethylene glycol.

These softeners are more definitively described in U.S. Patent 4,134,838. Preferred fabric softeners for use herein are acyclic quaternary ammonium salts, di(hydrogenated)tallow dimethyl ammonium methylsulphate is most preferred for dryer articles of this invention. Especially preferred are mixtures of di(hydrogenated)tallow dimethyl ammonium methylsulphate with fatty acids, particularly stearic acid.

The amount of fabric softening composition on a sheet is subject to normal coating parameters such as, for example, viscosity and melting point, of the fabric softening component and is typically 0.5 g to 5 g, preferably 1 g to 3.5 g. Optional ingredients include brighteners or fluorescent agents, colourants, germicides and bactericides.

The following examples will more fully illustrate the embodiments of this invention. All parts, percentages and proportions referred to herein and in the claims are by weight unless otherwise indicated.

Example 1

An emulsion containing a blend of a self-emulsifiable wax, a non self-emulsifiable wax and a perfume mixture dispersed in polyvinyl alcohol solution was prepared by the following process. 20g of the self-emulsifiable Duroxon J-324 wax (M.P. 105-115°C, Durachem), 20g of non self-emulsifiable Unilin 700 Wax (M.P. 110°C, Petrolite), 0.50g of potassium hydroxide and 20g of deionized water were charged to a 500ml reactor equipped with stirrer, temperature controller and condenser. The reactor was heated and maintained at 100°C until all the wax melted to form a smooth uniform solution. 16g of boiling deionized water was added slowly to the molten water mixture and the temperature was maintained at 100°C until a crystal clear solution was observed. Following this, 44g of perfume (ex-International Flavours & Fragrances) was added slowly to the wax mixture at 100°C to yield a honey-like viscous solution. 80g of boiling deionized water was then added to the reactor to form a milky wax/perfume mixture emulsion. To this emulsion, 136g of polyvinyl alcohol solution (Molecular Weight 2,000, 17.6% solid) was added and the emulsion was cooled to 40-50°C with a water bath to form a stable emulsion. The resulting emulsion was spray dried at 120°C inlet air temperature using Yamato GA 31 minisprayer dryer to yield the microcapsule with 40% perfume loading.

Example 2

An emulsion containing a blend of self-emulsifiable wax and perfume dispersed in a polyvinylalcohol solution was prepared as follows. To a 1 litre reactor equipped with stirrer, temperature controller and condenser was charged 45g of self-emulsifiable Unithox 450 wax (m.p. 90°C, Petrolite). The reactor was heated and maintained at 95°C until all the wax melt. 90g of perfume (ex-IFF) was added slowly to the reactor for a period of 5 to 8 minutes and the temperature was maintained at 90°C to form a clear solution. Following this, 222g of hot deionized water (90°C) was added to the mixture of molten wax and perfume to form a milky emulsion. 390g of polyvinylalcohol solution (Molecular Weight

EP 0 539 025 B1

2,000, 23.1% solid) was added to the reactor and the emulsion was cooled to 40-50°C with a water bath. The resulting emulsion was then spray dried at 150°C inlet air temperature and 70°C air outlet temperature using Yamato GA31 minispray dryer to make the microcapsule with 40% perfume loading.

5 Example 3

An emulsion containing a blend of self-emulsifiable wax and perfume dispersed in a polyvinylalcohol solution was prepared as follows. To a 1 litre reactor equipped with stirrer, temperature controller and condenser was charged 22.5g of Unithox 450 wax and 22.5g of ditallowdimethylammonium methylsulphate. The reactor was heated and maintained at 95°C until all the wax melted. 90g of perfume (ex- IFF) was added slowly to the reactor for a period of 5 to 8 minutes and the temperature was maintained at 90°C to form a clear solution. Following this, 222g of hot deionized water (90°C) was added to the mixture of molten wax and perfume to form a milky emulsion. 390g of polyvinylalcohol solution (Molecular weight 2,000, 23.1% solid) was added to the reactor and the emulsion was cooled to 40-50°C with a water bath. The resulting emulsion was then spray dried at 150°C inlet air temperature and 70°C air outlet temperature using Yamato GA31 minispray dryer to make the microcapsule with 40% perfume loading.

Example 4

An emulsion containing a blend of self-emulsifiable wax and perfume dispersed in a polyvinylalcohol solution was prepared as follows. To a 1 litre reactor equipped with stirrer, temperature controller and condenser was charged 45g of self-emulsifiable Unithox 750 wax (m.p. 110°C, Petrolite). The reactor was heated and maintained at 95°C until all the wax melted. 90g of perfume (ex- IFF) was added slowly to the reactor for a period of 5 to 8 minutes and the temperature was maintained at 90°C to form a clear solution. Following this, 222g of hot deionized water (90°C) was added to the mixture of molten wax and perfume to form a milky emulsion. 390g of polyvinylalcohol solution (Molecular Weight 2,000, 23.1% solid) was added to the reactor and the emulsion was cooled to 40-50°C with a water bath. The resulting emulsion was then spray dried at 150°C inlet air temperature and 70°C air outlet temperature using Yamato GA31 minispray dryer to make the microcapsule with 40% perfume loading.

Example 5

An emulsion containing a blend of self-emulsifiable wax and perfume dispersed in a hydrophobically modified starch solution was prepared as follows. To a 500ml reactor equipped with stirrer, temperature controller and condenser was charged 30g of self-emulsifiable Unithox 450 wax (m.p. 90°C, Petrolite). The reactor was heated and maintained at 95°C until all the wax melted. 60g of perfume (ex- IFF) was added slowly to the reactor for a period of 5 to 8 minutes and the temperature was maintained at 90°C to form a clear solution. Following this, 90g of hot deionized water (90°C) was added to the mixture of molten wax and perfume to form a milky emulsion. 100g of Capsul solution (National Starch and Chemical Corp., 30% solid) was added to the reactor and the emulsion was cooled to 40-50°C with a water bath. The resulting emulsion was then spray dried at 120°C inlet air temperature and 60°C air outlet temperature using Yamato GA31 minispray dryer to make the microcapsule with 50% perfume loading.

Characteristics of Capsules

The composition and the characteristics of the prepared capsules are shown in Table I. The % washable perfume oil is determined by washing the capsule with n-hexane. Two grams of capsule are weighed into a Buchner funnel. 40g of hexane is added to the funnel. The hexane is removed by applying vacuum and the washed capsule is air dried to a constant weight. The % washable oil is then calculated from the amount of perfume oil removed and the total oil contained in the capsule.

Table I

Capsule	Composition	% Washable Oil
Example 1	40.8% Perfume, 18.6% Duroxon J-324 18.6% Uniline 700, 22% PVA	44%
Example 2	40% Perfume, 20% Unithox 450 40% PVA	1.3%

EP 0 539 025 B1

Table I (continued)

Capsule	Composition	% Washable Oil
Example 3	40% Perfume, 10% Unithox 450 10% Ditallowdimethylammonium Methyl Sulfate 40% PVA	1.6%
Example 4	40% Perfume, 20% Unithox 750 40% PVA	3.75%
Example 5	50% Perfume, 25% Unithox 450 25% Capsul ^(R)	66%

Examples 6-8 are comparative examples

Example 6

This example gives a comparison of the result obtained by using a mixture of nonemulsifiable core material for the preparation of perfume/wax microcapsules by the same process described in example 2. 19g of C₃₀ alcohol (Uniline 425, ex-Petrolite) was charged into a 500ml reactor. The reactor was heated and maintained at 95°C until all the wax melted. 19g of perfume (ex-IFF) was added slowly to the molten wax and the temperature was maintained at 90°C to form a clear solution. 114g of hot deionized water was then added to the reactor. Following this addition, 152g of polyvinylalcohol solution (25% solid, 2,000 MW) was added to the reactor and the reactor was cooled to 40°C with a water bath. It was observed that instead of forming a stable emulsion, the wax/perfume mixture formed large aggregates which could not be spray dried.

Example 7

A wax and perfume mixture was encapsulated in a modified starch Capsul (ex-National Starch and Chemical Corp.) using the process described in U.S. Patent 3,091,567. Capsul is a modified food starch derived from waxy maize especially designed for spray drying encapsulation of perfumes and flavours. 40g of Capsul and 160g of deionized water were added to a 500ml reactor. The reactor was heated and maintained at 90°C until all the Capsul dissolved. At the same time, a wax and perfume mixture was prepared by melting 20g of Uniline 425 wax (ex-Petrolite) and 20g of perfume (ex-IFF) at 90°C. The wax and perfume mixture was added to the reactor and agitated with the Capsul solution at 90°C for 30 minutes. The resulting emulsion was then cooled to 40°C with a water bath. Rather than forming a stable emulsion, the wax and perfume mixture formed large aggregates which could not be spray dried.

Example 8

Microcapsules were formed using polyvinyl alcohol by the process described in Example 2. In this example, the core material is perfume only, without wax. 40g of perfume (ex-IFF) was emulsified into 164g of polyvinyl alcohol (24.5% solid, 2,000 M.W.) to form a stable perfume emulsion. The perfume emulsion was spray dried at 120° inlet air temperature and 60°C outlet air temperature using Yamato GA31 minispray dryer. The sprayed emulsion was heavily coated on the wall of drying chamber and could not be used to produce free flowing perfume capsules.

Example 9: Fabric Softener Sheet Preparation

Fabric softener dryer sheets comprising a perfume-containing fabric softener composition coated on a polyester substrate were prepared as follows. The perfume-containing softener active composition was prepared by admixing 36 grams of perfume microcapsule with 900 grams of molten softener active comprising 70 wt.% ditallowdimethylammonium methylsulphate and 30 wt.% C₁₆₋₁₈ fatty acid at 75°C for 4-6 minutes. After the addition was completed, the molten softener active was transferred to a 3-roller Lyons Bench Coater preheated to 79°C. The molten softener active was then coated on 229 mm by 279 mm (9 inches by 11 inches) polyester substrate with a coating weight 1.6 grams per sheet. The perfume microcapsules of Example 2 and Example 3 were used for the sheet preparation. The same procedure was also used to make one softener sheet containing 4 wt.% of free perfume oil.

EP 0 539 025 B1

Example 10: Fabric Perfume Odour Test

This test compares the effectiveness of perfume microcapsule vs. free (non-encapsulated) perfume oil in perfume substantivity to fabric after a dryer cycle. In this test, 2,72 Kg (6 lbs.) of freshly washed fabrics are dried for 40 minutes in a Kenmore electric dryer (Lady Kenmore). At the start of the drying cycle, 229 mm by 279 mm (9 inches by 11 inches) of perfume-containing fabric softener sheet is placed on the top of the clothes. Two dryers are used for the test. In one drier the sheet containing the free perfume oil is used while the other drier contains the perfume microcapsule. At the end of the drying cycle, the fabrics are removed from the dryer. The odour from the treated fabrics is compared. Evaluation results (Table II) show that fabrics treated with the sheet containing either Example 2 or Example 3 microcapsules gave stronger perfume odour than those treated with the sheet containing the free perfume oil even at a lower total perfume level (1.6 wt.% vs. 4 wt.%).

Table II

	% Perfume	% Perfume Capsule	Perfume Odour
Sheet 1	4%	None	Weak
Sheet 2	1.6%	4% Example 2	Stronger
Sheet 3	1.6%	4% Example 3	Stronger

The following terms used herein are trade marks: Polywax 500; Duroxon; Duroxo; Bestowax; Durmont; Carnauba; Durawax, Unithox; Unilin; and Span.

Claims

1. A tumble drier article of manufacture adapted for conditioning fabric in an automatic clothes drier comprising:

- (a) a fabric softening composition comprising a fabric softener selected from the group consisting of: cationic quaternary ammonium salts, tertiary fatty amines having at least one and preferably two C₈ to C₃₀ alkyl groups, carboxylic acids having 8 to 30 carbon atoms and one carboxy group per molecule, esters of polyhydric alcohols, fatty alcohols, ethoxylated fatty alcohols, alkyl phenols, ethoxylated alkyl phenols, ethoxylated fatty amines, ethoxylated monoglycerides, ethoxylated diglycerides, mineral oils, polyols and mixtures thereof;
- (b) between 0.5 and 80% by weight of spray dried composite microcapsules having a diameter less than 100 micrometers, each microcapsule material comprising a water soluble polymer and individual particles of an emulsifiable mixture of a self-emulsifiable wax material and, optionally, a non-self-emulsifiable wax material and a perfume composition, the mixture having a melting point between 35 and 90°C and the ratio of self-emulsifiable to non-self-emulsifiable wax being at least 1:3; wherein the wax material and the perfume composition are dispersed in the water soluble polymer, the individual particles of the mixture of wax and perfume composition having an average diameter of less than 5 micrometers; and
- (c) dispensing means for releasing the fabric softening composition and the microcapsules onto fabrics, the fabric softening composition being releasably attached to the dispensing means in a weight ratio of from 10:1 to 0.5:1 of the fabric softening composition to the dispensing means.

- 2. The tumble drier article according to claim 1 wherein the water soluble polymer is selected from the group consisting of a synthetic polymer, a natural polymer or modified natural polymer having a molecular weight of less than 100 000 and mixtures thereof.
- 3. The tumble drier article according to claim 1 wherein the wax material is selected from the group consisting of a hydrocarbon based paraffin wax and a hydrocarbon based microcrystalline wax.
- 4. The tumble drier article according to claim 1 wherein the emulsifiable mixture of wax and perfume composition further comprises a surfactant.
- 5. The tumble drier article according to claim 4, wherein the surfactant is a nonionic surfactant derived from, C₁₆, C₃₀, C₄₀ or C₅₀ average carbon chain length alcohols, a cationic fabric softening component, or mixtures thereof.
- 6. The tumble drier article according to claim 4, wherein the surfactant is an ethoxylated primary alcohol or a cationic

EP 0 539 025 B1

fabric softening compound.

7. The tumble drier article according to claim 1, wherein the water soluble polymer is a synthetic polymer and is a material selected from the group consisting of polyvinyl pyrrolidine, a water soluble cellulose, a polyvinyl alcohol, a polyethylene oxide, a homo- or copolymer of acrylic acid or methacrylic acid or mixtures thereof, ethylene maleic anhydride copolymer, methyl vinyl ether maleic anhydride copolymer, a water soluble polyamide or polyester, or mixtures thereof.
8. The tumble drier article to claim 7 wherein the synthetic polymer is polyvinyl pyrrolidine or polyvinyl alcohol.
9. A tumble drier article according to claim 1 wherein the natural polymer is a starch, a gum, or a gelatin.
10. A tumble drier article according to claim 1 wherein each of the composite microcapsules has a diameter of less than 100 micrometers.
11. A tumble drier article according to claim 10 wherein each microcapsule has a diameter of 3 to 100 micrometers.
12. A tumble drier article according to claim 11 wherein each of the microcapsules has a diameter of 3 to 40 micrometers.
13. A tumble drier article according to claim 1 wherein the particles have an average diameter of less than 1 micrometer.
14. A composite microcapsule containing a fragrance oil comprising:
 - (a) particles composed of an emulsifiable mixture of a self-emulsifiable wax material and, optionally, a non-self-emulsifiable wax material, and a perfume composition, the mixture having a melting point between 35 and 90°C, the ratio of self-emulsifiable to non-self-emulsifiable wax being at least 1:3, the particles having an average diameter of less than 5 micrometers; and
 - (b) a water soluble polymer encapsulating the particles to form composite microcapsules having a diameter less than 100 micrometers whereby the fragrance oil is released by dissolving the polymer upon contact with a liquid and melting the wax material at a temperature below 90°C, the microcapsules having been formed by a spray drying process.
15. The composite microcapsule according to claim 14, wherein the emulsifiable mixture comprises a wax selected from the group consisting of a hydrocarbon based paraffin wax and a hydrocarbon based microcrystalline wax.
16. The composite microcapsule according to claim 14, wherein the emulsifiable mixture further comprises a surfactant selected from the group consisting of a nonionic surfactant derived from C₁₆, C₃₀, C₄₀ or C₅₀ average carbon chain length alcohols, a cationic fabric softening component, or mixtures thereof.
17. The composite microcapsule according to claim 14, wherein the water soluble polymer is a synthetic polymer, natural polymer or a modified natural polymer.
18. The composite microcapsule according to claim 17, wherein the synthetic polymer is a material selected from the group consisting of polyvinyl pyrrolidine, a water soluble cellulose, a polyvinyl alcohol, a polyethylene oxide, a homo- or copolymer of acrylic acid or methacrylic acid or mixtures thereof, ethylene maleic anhydride copolymer, methyl vinyl ether maleic anhydride copolymer, a water soluble polyamide or polyester, or mixtures thereof.
19. The composite microcapsule according to claim 14 wherein each microcapsule has a diameter of 3 to 100 micrometers.
20. The composite microcapsule according to claim 19 wherein each of the microcapsules has a diameter of 3 to 40 micrometers.
21. The composite microcapsule according to any one of claims 14 to 20 wherein the microcapsule is solid or in gel form at room temperature.
22. A composite microcapsule article according to claim 14 wherein the ratio of wax material to the fragrance oil is 1:

EP 0 539 025 B1

4 to 4:1.

23. A process for making a composite microcapsule of claim 14 comprising the steps of:

- 5 (a) selecting a self-emulsifiable wax material and, optionally, a non-self-emulsifiable wax material, and a perfume composition to form an emulsifiable mixture having a melting point of between 35° and 90°C, the ratio by weight of self-emulsifiable to non-self-emulsifiable wax material being at least 1:3;
- (b) selecting a water-soluble polymer;
- 10 (c) melting the emulsifiable mixture in a reactor until a uniform solution is obtained;
- (d) adding water to the uniform solution to form an aqueous emulsion;
- 15 (e) adding the water soluble polymer to the aqueous emulsion and cooling the resulting mixture to form a stable emulsion; and
- (f) spray drying the stable emulsion to yield a composite microcapsule having a diameter of less than 100 micrometers.
- 20

Patentansprüche

- 25 1. Gegenstand für Wäschetrockner, ausgelegt zum Veredeln von Textilien in einem automatischen Wäschetrockner, umfassend:
 - (a) eine textilweichmachende Zusammensetzung, umfassend einen Textilweichmacher, ausgewählt aus der Gruppe, bestehend aus: kationischen quaternären Ammoniumsalzen, tertiären Fettaminen mit mindestens einer und vorzugsweise zwei C₈-C₃₀-Alkylgruppen, Carbonsäuren mit 8 bis 30 Kohlenstoffatomen und einer Carboxygruppe pro Molekül, Estern von mehrwertigen Alkoholen, Fettalkoholen, ethoxylierten Fettalkoholen, Alkylphenolen, ethoxylierten Alkylphenolen, ethoxylierten Fettaminen, ethoxylierten Monoglyceriden, ethoxylierten Diglyceriden, Mineralölen, Polyolen und Gemischen davon;
 - (b) zwischen 0,5 und 80 Gewichtsprozent sprühgetrocknete Kompositmikrokapseln mit einem Durchmesser von weniger als 100 Mikrometern, wobei jedes Mikrokapselmaterialein wasserlösliches Polymer und einzelne Teilchen eines emulgierbaren Gemisches von einem selbst-emulgierbaren Wachsmaterial und gegebenenfalls einem nicht selbst-emulgierbaren Wachsmaterial und einer Parfumszusammensetzung umfaßt, wobei das Gemisch einen Schmelzpunkt zwischen 35 und 90°C aufweist und das Verhältnis von selbst-emulgierbarem zu nicht selbst-emulgierbarem Wachs mindestens 1:3 ist, wobei das Wachsmaterial und die Parfumszusammensetzung in dem wasserlöslichen Polymer dispergiert sind, die einzelnen Teilchen des Gemisches von Wachs und Parfumszusammensetzung einen mittleren Durchmesser von weniger als 5 Mikrometern aufweisen; und
 - (c) eine Ausgabevorrichtung zur Freisetzung der textilweichmachenden Zusammensetzung und der Mikrokapseln auf die Textilien, wobei die textilweichmachende Zusammensetzung freisetzbar an die Ausgabevorrichtung in einem Gewichtsverhältnis von textilweichmachender Zusammensetzung zur Ausgabevorrichtung von 10:1 bis 0,5:1 gebunden ist.
- 45 2. Gegenstand für Wäschetrockner nach Anspruch 1, wobei das wasserlösliche Polymer ausgewählt ist aus der Gruppe, bestehend aus einem synthetischen Polymer, einem natürlichen Polymer oder modifiziertem natürlichen Polymer mit einem Molekulargewicht von weniger als 100000 und Gemischen davon.
- 50 3. Gegenstand für Wäschetrockner nach Anspruch 1, wobei das Wachsmaterial ausgewählt ist aus der Gruppe, bestehend aus einem auf Kohlenwasserstoff basierenden Paraffinwachs und einem auf Kohlenwasserstoff basierenden mikrokristallinen Wachs.
- 55 4. Gegenstand für Wäschetrockner nach Anspruch 1, wobei das emulgierbare Gemisch aus Wachs und Parfumszusammensetzung außerdem ein Tensid umfaßt.
5. Gegenstand für Wäschetrockner nach Anspruch 4, wobei das Tensid ein nichtionisches Tensid darstellt, abgeleitet von Alkoholen mit einer mittleren Kohlenstoffkettenlänge von C₁₆, C₃₀, C₄₀ oder C₅₀, einer kationischen textil-

A

EP 0 539 025 B1

weichmachenden Komponente oder Gemischen davon.

6. Gegenstand für Wäschetrockner nach Anspruch 4, wobei das Tensid ein ethoxylierter primärer Alkohol oder eine kationische textilweichmachende Verbindung darstellt.
- 5 7. Gegenstand für Wäschetrockner nach Anspruch 1, wobei das wasserlösliche Polymer ein synthetisches Polymer ist und ein Material, ausgewählt aus der Gruppe, bestehend aus Polyvinylpyrrolidon, einer wasserlöslichen Cellulose, einem Polyvinylalkohol, einem Polyethylenoxid, einem Homo- oder Copolymer von Acrylsäure oder Methacrylsäure oder Gemischen davon, Ethylen-Maleinsäureanhydrid-Copolymer, Methylvinylether-Maleinsäureanhydrid-Copolymer, einem wasserlöslichen Polyamid oder Polyester oder Gemischen davon, darstellt.
- 10 8. Gegenstand für Wäschetrockner nach Anspruch 7, wobei das synthetische Polymer Polyvinylpyrrolidon oder Polyvinylalkohol ist.
- 15 9. Gegenstand für Wäschetrockner nach Anspruch 1, wobei das natürliche Polymer eine Stärke, ein Gummi oder eine Gelatine darstellt.
10. Gegenstand für Wäschetrockner nach Anspruch 1, wobei jede der Kompositmikrokapseln einen Durchmesser von weniger als 100 Mikrometern aufweist.
- 20 11. Gegenstand für Wäschetrockner nach Anspruch 10, wobei jede Mikrokapsel einen Durchmesser von 3 bis 100 Mikrometern aufweist.
12. Gegenstand für Wäschetrockner nach Anspruch 11, wobei jede der Mikrokapseln einen Durchmesser von 3 bis 40 Mikrometern aufweist.
- 25 13. Gegenstand für Wäschetrockner nach Anspruch 1, wobei die Teilchen einen mittleren Durchmesser von weniger als 1 Mikrometer aufweisen.
- 30 14. Kompositmikrokapsel, enthaltend ein Duftöl, umfassend:
 - (a) Teilchen, zusammengesetzt aus einem emulgierbaren Gemisch eines selbst-emulgierbaren Wachsmaterials und gegebenenfalls eines nicht selbst-emulgierbaren Wachsmaterials und einer Parfumszusammensetzung, wobei das Gemisch einen Schmelzpunkt zwischen 35 und 90°C aufweist, das Verhältnis von selbst-emulgierbarem zu nicht selbst-emulgierbarem Wachs mindestens 1:3 ist, die Teilchen einen mittleren Durchmesser von weniger als 5 Mikrometern aufweisen; und
 - (b) ein wasserlösliches Polymer, das die Teilchen unter Bildung von Kompositmikrokapseln mit einem Durchmesser von weniger als 100 Mikrometern einkapselt, wobei das Duftöl durch Auflösen des Polymers nach Kontakt mit einer Flüssigkeit und Schmelzen des Wachsmaterials bei einer Temperatur unterhalb 90°C freigesetzt wird, wobei die Mikrokapseln durch ein Sprühtrockenverfahren hergestellt wurden.
- 35 15. Kompositmikrokapsel nach Anspruch 14, wobei das emulgierbare Gemisch ein Wachs, ausgewählt aus der Gruppe, bestehend aus einem auf Kohlenwasserstoff basierenden Paraffinwachs und einem auf Kohlenwasserstoff basierenden mikrokristallinen Wachs, umfaßt.
- 45 16. Kompositmikrokapsel nach Anspruch 14, wobei das emulgierbare Gemisch weiterhin ein Tensid, ausgewählt aus der Gruppe, bestehend aus einem nichtionischen Tensid, abgeleitet von Alkoholen mit einer mittleren Kohlenstoffkettenlänge von C₁₆, C₃₀, C₄₀ oder C₅₀, einer kationischen textilweichmachenden Komponente oder Gemischen davon umfaßt.
- 50 17. Kompositmikrokapsel nach Anspruch 14, wobei das wasserlösliche Polymer ein synthetisches Polymer, natürliches Polymer oder ein modifiziertes natürliches Polymer darstellt.
- 55 18. Kompositmikrokapsel nach Anspruch 17, wobei das synthetische Polymer ein Material, ausgewählt aus der Gruppe, bestehend aus Polyvinylpyrrolidon, einer wasserlöslichen Cellulose, einem Polyvinylalkohol, einem Polyethylenoxid, einem Homo- oder Copolymer von Acrylsäure oder Methacrylsäure oder Gemischen davon, Ethylen-Maleinsäureanhydrid-Copolymer, Methylvinylether-Maleinsäureanhydrid-Copolymer, einem wasserlöslichen Polyamid oder Polyester oder Gemischen davon, darstellt.

EP 0 539 025 B1

19. Kompositmikrokapsel nach Anspruch 14, wobei jede Mikrokapsel einen Durchmesser von 3 bis 100 Mikrometern aufweist.
20. Kompositmikrokapsel nach Anspruch 19, wobei jede der Mikrokapseln einen Durchmesser von 3 bis 40 Mikrometern aufweist.
21. Kompositmikrokapsel nach einem der Ansprüche 14 bis 20, wobei die Mikrokapsel bei Raumtemperatur fest oder in Gelform vorliegt.
22. Kompositmikrokapselgegenstand nach Anspruch 14, wobei das Verhältnis von Wachsmaterial zu dem Duftöl 1:4 bis 4:1 ist.
23. Verfahren zur Herstellung einer Kompositmikrokapsel nach Anspruch 14, umfassend die Schritte von:
- (a) Auswählen eines selbst-emulgierbaren Wachsmaterials und gegebenenfalls eines nicht selbst-emulgierbaren Wachsmaterials und einer Parfumszusammensetzung zur Bildung eines emulgierbaren Gemisches mit einem Schmelzpunkt zwischen 35° und 90°C, wobei das Gewichtsverhältnis von selbst-emulgierbarem zu nicht selbst-emulgierbarem Wachsmaterial mindestens 1:3 ist;
 - (b) Auswählen eines wasserlöslichen Polymers;
 - (c) Schmelzen des emulgierbaren Gemisches in einem Reaktor, bis eine gleichförmige Lösung erhalten wird;
 - (d) Zugabe von Wasser zu der gleichförmigen Lösung unter Bildung einer wässrigen Emulsion;
 - (e) Zugabe des wasserlöslichen Polymers zu der wässrigen Emulsion und Abkühlen des erhaltenen Gemisches zur Bildung einer stabilen Emulsion; und
 - (f) Sprühtrocknen der stabilen Emulsion unter Gewinnung einer Kompositmikrokapsel mit einem Durchmesser von weniger als 100 Mikrometern.

Revendications

1. Article pour séchoir à tambour de fabrication, adapté pour le conditionnement des tissus dans un séchoir automatique pour étoffes comportant :
- (a) une composition adoucissante pour tissu, comportant un agent adoucissant pour tissu, choisi dans le groupe constitué : des sels cationiques d'ammonium quaternaire, des amines grasses tertiaires ayant au moins un et de préférence deux groupes alkyle en C₈ à C₃₀, des acides carboxyliques ayant de 8 à 30 atomes de carbone et un groupe carboxy par molécule, des esters d'alcools polyhydriques, des alcools gras, des alcools gras éthoxylés, des alkyl-phénols, des alkyl-phénols éthoxylés, des amines grasses éthoxylées, des monoglycérides éthoxylés, des diglycérides éthoxylés, des huiles minérales, des polyols et des mélanges de ceux-ci ;
 - (b) entre 0,5 et 80% en poids de microcapsules composites, séchées par pulvérisation, qui ont un diamètre inférieur à 100 microns, chaque composant de microcapsule comportant un polymère soluble dans l'eau et des particules individuelles d'un mélange émulsifiable d'un matériau à base de cire auto-émulsifiable et, le cas échéant, d'un matériau à base de cire non-auto-émulsifiable et d'une composition de parfum, le mélange ayant un point de fusion entre 35 et 90°C tandis que le rapport de la cire auto-émulsifiable à la cire non-auto-émulsifiable est d'au moins 1:3 ; dans laquelle le matériau à base de cire et la composition de parfum sont dispersés dans le polymère soluble dans l'eau, les particules individuelles du mélange de cire et de la composition de parfum ayant un diamètre moyen inférieur à 5 microns ; et
 - (c) un moyen de distribution pour libérer la composition adoucissante pour tissus et les microcapsules sur les tissus, la composition adoucissante pour tissu étant fixée, de façon amovible, au moyen de distribution selon un rapport pondéral de 10:1 à 0,5:1 entre la composition adoucissante pour tissu et le moyen de distribution.
2. Article pour séchoir à tambour selon la revendication 1, dans lequel le polymère soluble dans l'eau est choisi dans le groupe constitué d'un polymère synthétique, d'un polymère naturel ou d'un polymère naturel modifié ayant un poids moléculaire inférieur à 100 000, ainsi que des mélanges de ceux-ci.
3. Article pour séchoir à tambour selon la revendication 1, dans lequel le matériau de type cire est choisi dans le groupe constitué d'une cire paraffinique à base d'hydrocarbure et d'une cire microcristalline à base d'hydrocarbure.

EP 0 539 025 B1

4. Article pour séchoir à tambour selon la revendication 1, dans lequel le mélange émulsifiable de la composition de cire et de parfum comporte en outre un agent tensioactif.
5. Article pour séchoir à tambour selon la revendication 4, dans lequel l'agent tensioactif est un agent tensioactif non-ionique dérivé d'alcools à longueur de chaîne carbonée moyenne en C_{16} , C_{30} , C_{40} ou C_{50} , d'un composant adoucissant cationique pour tissu ou de mélanges de ceux-ci.
6. Article pour séchoir à tambour selon la revendication 4, dans lequel l'agent tensioactif est un alcool primaire éthoxylé ou un composé adoucissant cationique pour tissu.
7. Article pour séchoir à tambour selon la revendication 1, dans lequel le polymère soluble dans l'eau est un polymère synthétique et est un matériau choisi dans le groupe constitué de la polyvinylpyrrolidone, d'une cellulose soluble dans l'eau, d'un alcool polyvinylique, d'un oxyde de polyéthylène, d'un homo- ou copolymère d'acide acrylique ou d'acide méthacrylique ou de mélanges de ceux-ci, d'un copolymère d'éthylène/anhydride maléique, d'un copolymère d'éther-méthyl vinylique/anhydride maléique, d'un polyamide ou d'un polyester, solubles dans l'eau, ou bien de mélanges de ceux-ci.
8. Article pour séchoir à tambour selon la revendication 7, dans lequel le polymère synthétique est une polyvinyl pyrrolidone ou un alcool polyvinylique.
9. Article pour séchoir à tambour selon la revendication 1, dans lequel le polymère naturel est un amidon, une gomme ou une gélatine.
10. Article pour séchoir à tambour selon la revendication 1, dans lequel chacune des microcapsules composites présente un diamètre inférieur à 100 microns.
11. Article pour séchoir à tambour selon la revendication 10, dans lequel chaque microcapsule présente un diamètre de 3 à 100 microns.
12. Article pour séchoir à tambour selon la revendication 11, dans lequel chacune des microcapsules présente un diamètre de 3 à 40 microns.
13. Article pour séchoir à tambour selon la revendication 1, dans lequel les particules ont un diamètre moyen inférieur à 1 micron.
14. Microcapsule composite renfermant une huile parfumante comportant :
- (a) des particules constituées d'un mélange émulsifiable d'un matériau à base de cire auto-émulsifiable et, le cas échéant, un matériau à base de cire non-auto-émulsifiable, et une composition de parfum, le mélange ayant un point de fusion se situant entre 35 et 90°C, le rapport de la cire auto-émulsifiable à la cire non-auto-émulsifiable étant d'au moins 1:3, tandis que les particules ont un diamètre moyen inférieur à 5 microns ; et
- (b) un polymère soluble dans l'eau, encapsulant les particules afin de former des microcapsules composites ayant un diamètre inférieur à 100 microns, de façon que l'huile parfumante soit libérée par dissolution du polymère après contact avec un liquide et fusion du matériau à base de cire à une température inférieure à 90°C, les microcapsules ayant été réalisées par un procédé de séchage par pulvérisation.
15. Microcapsule composite selon la revendication 14, dans laquelle le mélange émulsifiable comporte une cire choisie dans le groupe constitué d'une cire paraffinique à base d'hydrocarbure et d'une cire microcristalline à base d'hydrocarbure.
16. Microcapsule composite selon la revendication 14, dans laquelle le mélange émulsifiable comporte en outre un agent tensioactif choisi dans le groupe constitué d'un agent tensioactif non-ionique dérivé d'alcools à longueur de chaîne carbonée moyenne en C_{16} , C_{30} , C_{40} ou C_{50} , d'un composant adoucissant cationique pour tissu ou de mélanges de ceux-ci.
17. Microcapsule composite selon la revendication 14, dans laquelle le polymère soluble dans l'eau est un polymère synthétique, un polymère naturel ou un polymère naturel modifié.

EP 0 539 025 B1

- 5 18. Microcapsule composite selon la revendication 17, dans laquelle le polymère synthétique est un matériau choisi dans le groupe constitué de la polyvinyl-pyrrolidone, d'une cellulose soluble dans l'eau, d'un alcool polyvinylique, d'un oxyde de polyéthylène, d'un homo- ou copolymère d'acide acrylique ou d'acide méthacrylique ou de mélanges de ceux-ci, d'un copolymère d'éthylène/anhydride maléique, d'un copolymère d'éther-méthyl vinylique/anhydride maléique, d'un polyamide ou d'un polyester, solubles dans l'eau, ou bien de mélanges de ceux-ci.
19. Microcapsule composite selon la revendication 14, dans laquelle chaque microcapsule présente un diamètre de 3 à 100 microns.
- 10 20. Microcapsule composite selon la revendication 19, dans laquelle chacune des microcapsules présente un diamètre de 3 à 40 microns.
- 15 21. Microcapsule composite selon l'une quelconque des revendications 14 à 20, dans laquelle la microcapsule est solide ou sous forme de gel à la température ambiante.
22. Article de type microcapsule composite selon la revendication 14, dans lequel le rapport du matériau de type cire à l'huile parfumante est de 1:4 à 4:1.
- 20 23. Procédé pour fabriquer une microcapsule composite selon la revendication 14, comportant les étapes de :
- (a) choisir un matériau du type cire, auto-émulsifiable, et, le cas échéant, un matériau du type cire non-auto-émulsifiable, et une composition de parfum afin de former un mélange émulsifiable ayant un point de fusion se situant entre 35° et 90°C, le rapport en poids du matériau de type cire auto-émulsifiable au matériau de type cire, non-auto-émulsifiable, étant d'au moins 1:3 ;
- 25 (b) choisir un polymère soluble dans l'eau ;
- (c) fondre le mélange émulsifiable dans un réacteur jusqu'à ce qu'une solution uniforme soit obtenue ; (d) ajouter de l'eau à la solution uniforme afin de former une émulsion aqueuse ;
- (e) ajouter le polymère soluble dans l'eau à l'émulsion aqueuse et refroidir le mélange résultant pour former une émulsion stable ; et
- 30 (f) sécher par pulvérisation l'émulsion stable pour obtenir une microcapsule composite ayant un diamètre inférieur à 100 microns.
